

Padala

A self-custody USDC wallet for Filipino workers in Japan sending money to family in GCash.

The Problem & My Solution

Filipino workers in Japan can buy USDC at a registered Japanese exchange, but it cannot be withdrawn directly to GCash's GCrypto.

- Under SBI VC Trade's published withdrawal rules, USDC cannot be withdrawn directly to PDAX, which runs GCrypto.
- So the sender needs their own wallet in between. Padala is that wallet.
- Only the sender holds the key. Padala never holds keys or funds.
- The sender needs only USDC. Padala's relayer pays the gas.
- The family receives USDC in GCrypto and converts it to pesos inside GCash.

How It Works

Exchange happens in SBI VC Trade and GCash. Padala only sends.

- 1. Buy USDC at SBI VC Trade and withdraw it to your own Padala wallet (Ethereum).
- 2. Pick a family member and an amount. Padala shows the pesos they will receive.
- 3. Sign one EIP-3009 authorization in the browser. No ETH needed.
- 4. A Node.js relayer submits it and pays the gas. It cannot change the recipient or the amount.
- 5. The family gets a confirmation page that reads the transfer from the chain.

Built with

Ethereum (Sepolia testnet), ethers.js,
EIP-3009, USDC testnet contract,
Node.js, HTML/CSS/JS, Claude Code

Status & Next Steps

It works end to end on the Ethereum Sepolia testnet today.

- Tested on Sepolia: create a wallet, receive test USDC, send, and the family page shows the on-chain confirmation.
- Why Ethereum: SBI VC Trade withdraws USDC on Ethereum only.
- Next: send a small real transfer to a GCrypto address to confirm how deposits are handled.
- Next: test the flow with Filipino workers in Japan and their families.
- Not claimed yet: lower cost or faster delivery than existing remittance services. I have not measured this.
